

IRG is now moving into office and factory space heating

Obviously, it is not only domestic properties that will need heat next Winter. Office and factory premises will as well to reduce the enormous cost of heating with gas or oil.

We are now being asked to provide Quotations for offices and factories so that businesses can heat with infrared and save huge money.

We have just provided a Specification for a Company with an office space of 620 square metres to heat the whole area with 97 infrared panels 600x600mms. All the panels inserted in the suspended ceiling at the total net cost of £14,945.30. Running costs of £7,898 a year or less with solar PV.

If there is a cheaper more practical way of heating an area of 620 square metres, we would love to hear about it.

There are no radiators to take up wall space. The heat will be distributed evenly across the office. There is no extra cost for servicing as no servicing is required. The life span of the panels will be up to 40 years so no replacement monies are required until the end of that period.

In fact, you could say Infrared heating in an office space is a Winner on all counts and cannot be beaten economically, practically or by any other option. IR provides the most effective and efficient heating for the people working in the office space.

If you have an office or factory space that will need heating this coming Winter, and you do not wish to pay huge sums for heating, please send us your floor plans with measurements and ceiling heights, and we will supply you a Specification at no charge.
